Decoding Polynomials

Tuning curves ($n = 128$)

$f(x) = 1$

$f(x) = x$

$f(x) = x^2$

$f(x) = x^3$

$f(x) = x^6$

LIF Tuning Curve Principal Components

Tuning curves ($n = 128$)

Principal Components

Singular values

ReLU Tuning Curve Principal Components

\approx Legendre Basis

Reminder: Legendre Polynomials

$$\varphi_i(x) = \frac{1}{2^i} \sum_{k=0}^i \binom{i}{k}^2 (x-1)^{i-k} (x+1)^k$$

Modifying the Basis – Same Maximum Rate (I)

Tuning curves ($n = 128$)

Principal Components

Singular values

Modifying the Basis – Equidistant x -Intercepts (II)

Modifying the Basis – Limited x-Intercepts (III)

Tuning curves ($n = 128$)

Principal Components

Singular values

Modifying the Basis – Symmetric Tuning Curves (IV)

Gaussian Tuning Curve Principal Components

\approx Fourier Basis

PCA of 2D Tuning Curves

Principal component 1

Principal component 2

Principal component 3

Principal component 4

Principal component 5

Principal component 6

PCA of 2D Tuning Curves

Principal component 1

Principal component 2

Principal component 3

Principal component 4

Principal component 5

Principal component 6

Combination of 2D Polynomials

Conclusions

- ▶ Can use **PCA** to find the basis functions underlying neural representations
- ▶ **Singular values** inversely proportional to noise
- ▶ **Basis function shape** depends on
 - ▶ x-intercept distributions
 - ▶ Neuron response curve $G[J]$
- ▶ Finding optimal tuning curves for representations
⇒ Full network optimization (must use gradient descent)
